Activity #8

1. Create a class called MyClass which contains two attributes - an integer num and a string str.

2. Create constructors for MyClass to allow MyClass objects to be instantiated as follows:
   ```
   myObject()
   myObject(int a, string b)
   ```

3. Create a MyClass method called print which outputs the state of a MyClass object.

4. Write a C++ program which instantiates a MyClass object and calls the print method.

Copy your code into a document and submit on Canvas. Include sample output.
